### Combining Damon with TADs: Concept, philosophies and an aim to broaden horizons

Any developing science evolves. & as one of the fastest growing dental specialties, Orthodontics has been doing so in the past 100 years of its existence. In its century of existence there has been a lot of landmarks in its evolution, but very few can match the clinical impact made by the self-ligating appliance and the temporary anchorage devices.

The aim of any clinical research is to improve the quality of treatment delivered together with the addition of precision, broadening the horizons of treatment & improve the compliance factor for both the patient & the clinician. The self-ligating appliance works to gold standard as the Invisalign system has been able to live up to the expectations of both the clinician and the patient. On the other hand, the temporary anchorage devices have brought about a renaissance to the field of orthodontics with its concept of absolute anchorage for the past decade. Its an added advantage in the hands of an experienced clinician to overcome new clinical challenges and convert even borderline surgical cases into non-surgical without compromising with the results achieved.

How about combining both TADs & Self-ligation for achieving what was clinically not possible before?

Although not an easy task but with renewed concepts and added technology it is definitely the way forward to the future. No appliance system is perfect, so both these together can complement each other in overcoming the minor loop holes and going beyond boundaries in achieving the ultimate goal - "Excellence".

### Class II Correction: Different approaches

Angle's Class II malocclusion is one of the most common orthodontic problems that occurs in 1/2nd of the population. Different approaches have been advised to achieve Class II correction. The basic aim is to have a patient non-compliant approach to achieve good treatment outcome. Speaker will cover the clinical cases regarding the use & biomechanics of Ormco implants as a method to control anchorage, simultaneous intrusion & retraction and arch distalization. The latter topic to be covered will be more to move Class I correctly (Advansync2) which helps to achieve Class II correction in Class I rms, thus reducing the need for 2-phase treatment. The presentation will cover the details of Advansync2 including appliance placement, biomechanics, case reports and clinical tips.
